Real Estate Property Listing App

Full-Stack Portfolio Project Plan — Oct 29, 2026 · @Abdelrahman

Why This Project

Real estate is one of the highest-paying niches on Upwork. A polished property app with map integration, advanced filters, and auth instantly qualifies you for $50–80/hr contracts. Real estate agencies and proptech startups pay premium rates — this project proves you can handle geospatial data, complex filtering, auth, and a polished multi-page app.

What to Build

- Property listing grid with advanced filters (price range slider, bedrooms, area, property type)
- Interactive map view with Leaflet markers and popups showing property previews
- Property detail pages with image gallery lightbox
- Auth with NextAuth.js (Google + email/password)
- Supabase backend for listings data and user favorites
- Mobile-first responsive design with bottom navigation on small screens
- Server-side filtering and pagination using Next.js Server Components

Tech Stack

Category	Technology	Purpose
Framework	Next.js 14 (App Router + Server Components)	SSR, routing, server-side filtering
Language	TypeScript	Type safety across the stack
Styling	Tailwind CSS	Utility-first responsive design
Animations	GSAP + Lenis + React Bits	Scroll animations, smooth scrolling, UI components
Database	Supabase (Postgres + Auth)	Listings data, user favorites, auth
Maps	Leaflet / React-Leaflet	Interactive map with property markers
Auth	NextAuth.js	Google + email/password sign-in
Carousel	Swiper.js	Image gallery and lightbox
Deploy	Vercel	Hosting with edge functions

Updated Stack: GSAP + Lenis + React Bits

Instead of Framer Motion, this project uses a more professional animation stack that stands out from typical AI-generated sites:

- **GSAP (GreenSock)** — Industry-standard animation library. ScrollTrigger for scroll-linked animations, SplitText for text reveals, timeline-based sequencing for complex entrance effects.
- **Lenis** — Smooth scroll library that makes the page feel buttery. Pairs with GSAP ScrollTrigger for scroll-driven animations that feel native, not janky.
- **React Bits** — Pre-built animated UI components (text animations, scroll reveals, backgrounds, buttons) that look polished out of the box. Saves time on micro-interactions.

> This combination signals to clients that you use real production tools, not beginner libraries.

Build Steps (Agent-Orchestrated)

1. **Design System** — Run the `website-design:design-system` skill with real estate site references (Zillow, Realtor.com, Compass) to generate a DESIGN.md. This prevents the "default Tailwind" look.
2. **Architecture** — Use `deep-reasoner` agent to plan component structure, data model, folder layout, and Supabase schema before writing code.
3. **Scaffold** — `fast-worker` agent runs `npx create-next-app@latest property-app --typescript --tailwind --app` and installs all deps.
4. **Supabase Setup** — Create a `properties` table and seed ~50 realistic Cairo/Egypt listings with title, price, bedrooms, area, lat/lng, and placeholder image URLs.
5. **Listing Grid + Filters** — `web-developer` agent builds the grid page with server-side filtering, pagination, and filter controls (price slider, bedrooms, property type).
6. **Map Integration** — `web-developer` agent integrates React-Leaflet with markers and click-to-preview popups.
7. **Property Detail Page** — Image gallery with Swiper.js carousel and lightbox, property info, favorites button.
8. **Auth** — NextAuth.js with Google provider + credentials, favorites/saved list tied to user.
9. **Animations** — `animation-specialist` agent adds GSAP ScrollTrigger entrances, Lenis smooth scroll, React Bits components for micro-interactions.
10. **Review & Polish** — `clean-code-reviewer` audits code, `website-design:review-page` reviews the visual output, fixes applied.

Supabase Database Schema

properties table

Column	Type	Notes
id	uuid (PK)	Default: gen_random_uuid()
title	text	e.g. "Modern 3BR Apartment in Zamalek"
description	text	Full property description
price	integer	Price in EGP
bedrooms	smallint	1-6
bathrooms	smallint	1-4
area_sqm	integer	Square meters
property_type	text	apartment | villa | studio | penthouse | duplex
address	text	Human-readable address
city	text	Cairo, Alexandria, etc.
district	text	Zamalek, Maadi, New Cairo, etc.
latitude	float8	For map markers
longitude	float8	For map markers
images	text[]	Array of image URLs
features	text[]	Pool, Garden, Parking, etc.
is_featured	boolean	Show in featured section
created_at	timestamptz	Default: now()

favorites table

Column	Type	Notes
id	uuid (PK)	Default: gen_random_uuid()
user_id	uuid (FK)	References auth.users
property_id	uuid (FK)	References properties.id
created_at	timestamptz	Default: now()

Seed script generates ~50 realistic Cairo property listings across Zamalek, Maadi, New Cairo, Sheikh Zayed, 6th of October, and Heliopolis with realistic EGP pricing.

Skills & Agents Map

Phase	Agent / Skill	What It Does
Design	website-design:design-system	Extracts visual direction from real sites
Design	frontend-design	Typography, color, layout decisions
Architecture	deep-reasoner (agent)	Component structure, data model planning
Scaffold	fast-worker (agent)	Boilerplate, folder setup, installs
Build	web-developer (agent)	Pages, components, SSR, data fetching
Animations	animation-specialist (agent)	GSAP, Lenis, scroll effects
Animations	gsap-scroll-trigger (skill)	ScrollTrigger-specific patterns
Animations	gsap-react (skill)	GSAP + React integration (useGSAP)
Charts	dataviz (skill)	Chart design that looks intentional
Review	clean-code-reviewer (agent)	Code quality audit
Review	website-design:review-page	Visual review of the final page
Polish	code-refactorer (agent)	Applies clean-code fixes

Upwork Presentation Tips

1. **Write it as a case study** — "Built a full-stack property listing platform with interactive map, server-side filtering across 50+ listings, and sub-2s load times" beats "Made a Next.js real estate website."

2. **Lead with the stack** — Upwork clients filter by technology. Name Next.js, TypeScript, Tailwind, Supabase, Leaflet, GSAP explicitly in your portfolio description.

3. **Deploy everything live** — A Vercel link a client can click and interact with is worth ten GitHub repos they won't open.

4. **Show the map interaction** — Record a 30-second Loom walkthrough clicking through filters, the map, and a property detail page. Clients watch videos; they skim text.

5. **Highlight the animations** — GSAP + Lenis is what separates a ■/hr dev from a ■/hr dev. Call out the smooth scroll and scroll-triggered animations.
